

# CS23336-Introduction to Python Programming

**Started on** Friday, 18 October 2024, 12:32 PM

**State** Finished

**Completed on** Friday, 18 October 2024, 11:14 PM

**Time taken** 10 hours 41 mins

**Marks** 10.00/10.00

**Grade** **100.00** out of 100.00

## Question 1

Correct

Mark 1.00 out of 1.00

Flag question

### Question text

Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

Output Format:

Print the Distinct Elements in Array in single line which is space Separated

Example Input:

5

1

2

2

3

4

Output:

1 2 3 4

Example Input:

6

1

1

2

2

3

3

Output:

1 2 3

For example:

Input	Result
-------	--------

5	
---	--

1	
---	--

2	
---	--

2	1 2 3 4
---	---------

3	
---	--

4	
---	--

6	
---	--

1	
---	--

1	
---	--

2	1 2 3
---	-------

2	
---	--

3	
---	--

3	
---	--

Answer:(penalty regime: 0 %)

```
1 n=int(input())
2 array=[int(input()) for _ in range(n)]
3 ele=set(array)
4 print(" ".join(map(str,ele)))
```

## Feedback

### Input Expected Got

```
5
1
2 1 2 3 4 1 2 3 4
2
3
4
```

```
6
1
1
2 1 2 3 1 2 3
2
3
3
```

Passed all tests!

//

Correct

Marks for this submission: 1.00/1.00.

## Question 2

Correct

Mark 1.00 out of 1.00

Flag question

### Question text

Given a matrix mat where every row is sorted in **strictly increasing** order, return the **smallest common element** in all rows.

If there is no common element, return -1.

### Example 1:

#### Input:

```
4 5
1 2 3 4 5
```

2 4 5 8 10

3 5 7 9 11

1 3 5 7 9

### Output:

5

### Constraints:

- $1 \leq \text{mat.length}, \text{mat}[i].\text{length} \leq 500$
- $1 \leq \text{mat}[i][j] \leq 10^4$
- $\text{mat}[i]$  is sorted in strictly increasing order.

Answer:(penalty regime: 0 %)

```
1 rows,col=map(int,input().split())
2 matrix=[list(map(int,input().split())) for _ in range(rows)]
3
4 count={}
5 for elem in matrix[0]:
6     count[elem]=1
7 for i in range(1,rows):
8     for elem in matrix[i]:
9         if elem in count and count[elem]== i + 1 - 1:
10             count[elem]+=1
11 smallestcommonelement=1
12 for elem in matrix[0]:
13     if count.get(elem)==rows:
14         smallestcommonelement=elem
15         break
16 print(smallestcommonelement)
```

### Feedback

#### Input Expected Got

4 5	5	5
1 2 3 4 5		
2 4 5 8 10		

Input	Expected Got
3 5 7 9 11	
1 3 5 7 9	

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

### Question 3

Correct

Mark 1.00 out of 1.00

Flag question

#### Question text

The program must accept **N** integers and an integer **K** as the input. The program must print every **K** integers in descending order as the output.

-

**Note:** If  $N \% K \neq 0$ , then sort the final  $N\%K$  integers in descending order.

#### Boundary Condition(s):

$1 \leq N \leq 10^4$

$-99999 \leq \text{Array Element Value} \leq 99999$

#### Input Format:

The first line contains the values of **N** and **K** separated by a space.

The second line contains **N** integers separated by space(s).

#### Output Format:

The first line contains **N** integers.

#### Example Input/Output 1:

Input:

```
7 3
48 541 23 68 13 41 6
```

Output:

541 48 23 68 41 13 6

Explanation:

The first three integers are 48 541 23, after sorting in descending order the integers are **541 48 23**.

The second three integers are 68 13 41, after sorting in descending order the integers are **68 41 13**.

The last integer is **6**.

The integers are **541 48 23 68 41 13 6**

Hence the output is **541 48 23 68 41 13 6**.

Answer:(penalty regime: 0 %)

```
1 n,k=map(int,input().split())
2 arr=list(map(int,input().split()))
3 for i in range(0,n,k):
4     chunk=arr[i:i+k]
5     chunk.sort(reverse=True)
6     print(*chunk,end=' ')
```

Feedback

Input	Expected	Got
7 3 48 541 23 68 13 41 6	541 48 23 68 41 13 6	541 48 23 68 41 13 6

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

## Question 4

Correct

Mark 1.00 out of 1.00

Flag question

### Question text

Complete the program to count frequency of each element of an array. Frequency of a particular element will be printed once.

### Sample Test Cases

#### Test Case 1

#### Input

7  
23  
45  
23  
56  
45  
23  
40

#### Output

23 occurs 3 times  
45 occurs 2 times  
56 occurs 1 times  
40 occurs 1 times

Answer:(penalty regime: 0 %)

```
1 n=int(input())  
2 ele=[]  
3 for _ in range(n):
```

```

4     ele.append(int(input()))
5     f={}
6     for n in ele:
7         if n in f:
8             f[n]+=1
9         else:
10            f[n]=1
11     for n,count in f.items():
12         print(f"{n} occurs {count} times")

```

## Feedback

23		
40		

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

## Question 5

Correct

Mark 1.00 out of 1.00

Flag question

### Question text

Assume you have an array of length  $n$  initialized with all 0's and are given  $k$  update operations.

Each operation is represented as a triplet: **[startIndex, endIndex, inc]** which increments each element of subarray **A[startIndex ... endIndex]** (startIndex and endIndex inclusive) with **inc**.

Return the modified array after all  $k$  operations were executed.

### Example:

### Input:

5  
3  
1 3 2  
2 4 3  
0 2 -2

### Output:

-2 0 3 5 3

### Explanation:

Initial state:

length = 5, updates = [[1,3,2],[2,4,3],[0,2,-2]]

[0,0,0,0,0]

After applying operation [1,3,2]:

[0,2,2,2,0]

After applying operation [2,4,3]:

[0,2,5,5,3]

After applying operation [0,2,-2]:

[-2,0,3,5,3]

Answer:(penalty regime: 0 %)

```
1 n=int(input())
2 k=int(input())
3 arr=[0]*(n+1)
4 for _ in range(k):
5     s,e,inc=map(int,input().split())
6     arr[s]+=inc
```

```

7   if e+1<n:
8       arr[e+1]-=inc
9   for i in range(1,n):
10      arr[i]+=arr[i-1]
11  print(' '.join(map(str,arr[:n])))

```

## Feedback

5		
3		
1 3 2	-2 0 3 5 3	-2 0 3 5 3
2 4 3		
0 2 -2		

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

## Question 6

Correct

Mark 1.00 out of 1.00

Flag question

### Question text

An array is monotonic if it is either **monotone increasing** or **monotone decreasing**.

An array A is monotone increasing if for all  $i \leq j$ ,  $A[i] \leq A[j]$ . An array A is monotone decreasing if for all  $i \leq j$ ,  $A[i] \geq A[j]$ .

Write a program if n array is monotonic or not. Print "True" if is monotonic or "False" if it is not. Array can be monotone increasing or decreasing.

Input Format:

First line n-get number of elements

Next n Lines is the array of elements

Output Format:

True ,if array is monotone increasing or decreasing.

otherwise False is printed

Sample Input1

4

5

6

7

## Question 7

Correct

Mark 1.00 out of 1.00

Flag question

### Question text

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that  $A[i] - A[j] = k$ ,  $i \neq j$ .

Input Format

1. First line is number of test cases T. Following T lines contain:
2. N, followed by N integers of the array
3. The non-negative integer k

Output format

Print 1 if such a pair exists and 0 if it doesn't.

Example

Input

1  
3  
1  
3  
5  
4

Output:

1

3
5
99
```

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

## Question 8

Correct

Mark 1.00 out of 1.00

Flag question

### Question text

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the  $p^{\text{th}}$  element of the list, sorted ascending. If there is no  $p^{\text{th}}$  element, return 0.

### Example

$n = 20$

$p = 3$

The factors of 20 in ascending order are  $\{1, 2, 4, 5, 10, 20\}$ . Using 1-based indexing, if  $p = 3$ , then 4 is returned. If  $p > 6$ , 0 would be returned.

### Constraints

$$1 \leq n \leq 10^{15}$$

$$1 \leq p \leq 10^9$$

The first line contains an integer  $n$ , the number to factor.

The second line contains an integer  $p$ , the 1-based index of the factor to return.

### Sample Case 0

### Sample Input 0

10

3

#### Sample Output 0

5

#### Explanation 0

Factoring  $n = 10$  results in  $\{1, 2, 5, 10\}$ . Return the  $p = 3^{\text{rd}}$  factor, 5, as the answer.

#### Sample Case 1

#### Sample Input 1

10

5

#### Sample Output 1

0

#### Explanation 1

Factoring  $n = 10$  results in  $\{1, 2, 5, 10\}$ . There are only 4 factors and  $p = 5$ , therefore 0 is returned as the answer.

#### Sample Case 2

#### Sample Input 2

1

1

#### Sample Output 2

1

#### Explanation 2

Factoring  $n = 1$  results in  $\{1\}$ . The  $p = 1^{\text{st}}$  factor of 1 is returned as the answer.

For example:

#### Input Result

10	
3	5

10	
5	0

## Input Result

1		
1	1	

Answer:(penalty regime: 0 %)

```
1 n=int(input())
2 p=int(input())
3 def factor(num):
4     fact=[]
5     for i in range(1,num+1):
6         if num%i==0:
7             fact.append(i)
8     return fact
9 fact1=factor(n)
10 if p<=len(fact1):
11     print(fact1[p-1])
12 else:
13     print(0)
```

## Feedback

3	5	5

10		
5	0	0

1		
1	1	1

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

## Question 9

Correct

Mark 1.00 out of 1.00

Flag question

## Question text

Given an integer  $n$ , return an list of length  $n + 1$  such that for each  $i$  ( $0 \leq i \leq n$ ),  $\text{ans}[i]$  is the number of 1's in the binary representation of  $i$ .

Example:

**Input:**  $n = 2$

**Output:**  $[0, 1, 1]$

**Explanation:**

0 --> 0

1 --> 1

2 --> 10

Example2:

**Input:**  $n = 5$

**Output:**  $[0, 1, 1, 2, 1, 2]$

**Explanation:**

0 --> 0

1 --> 1

2 --> 10

3 --> 11

4 --> 100

5 --> 101

Note: Complete the given function alone

For example:

**Test**

**Result**

```
print(CountingBits(5)) [0, 1, 1, 2, 1, 2]
```

Answer:(penalty regime: 0 %)

Reset answer

```
1 def CountingBits(n):
2     ans=[0]*(n+1)
3     for i in range(1,n+1):
4         ans[i]=ans[i>>1]+(i&1)
5     return ans
```

## Feedback

Test	Expected	Got
<code>print(CountingBits(2))</code>	<code>[0, 1, 1]</code>	<code>[0, 1, 1]</code>
<code>print(CountingBits(5))</code>	<code>[0, 1, 1, 2, 1, 2]</code>	<code>[0, 1, 1, 2, 1, 2]</code>

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

## Question 10

Correct

Mark 1.00 out of 1.00

Flag question

### Question text

Given two arrays of positive integers, for each element in the second array, find the total number of elements in the first array which are *less than or equal* to that element. Store the values determined in an array.

For example, if the first array is `[1, 2, 3]` and the second array is `[2, 4]`, then there are 2 elements in the first array *less than or equal* to 2. There are 3 elements in the first array which are *less than or equal* to 4. We can store these answers in an array, *answer* = `[2, 3]`.

### Program Description

The program must return an array of  $m$  positive integers, one for each  $maxes[i]$  representing the total number of elements  $nums[j]$  satisfying  $nums[j] \leq maxes[i]$  where  $0 \leq j < n$  and  $0 \leq i < m$ , in the given order.

The program has the following:

$nums[nums[0], \dots, nums[n-1]]$ : first array of positive integers

$maxes[maxes[0], \dots, maxes[m-1]]$ : second array of positive integers

### Constraints

- $2 \leq n, m \leq 10^5$
- $1 \leq nums[j] \leq 10^9$ , where  $0 \leq j < n$ .
- $1 \leq maxes[i] \leq 10^9$ , where  $0 \leq i < m$ .

### Input Format For Custom Testing

Input from stdin will be processed as follows and passed to the program.

The first line contains an integer  $n$ , the number of elements in  $nums$ .

The next  $n$  lines each contain an integer describing  $nums[j]$  where  $0 \leq j < n$ .  
The next line contains an integer  $m$ , the number of elements in  $maxes$ .  
The next  $m$  lines each contain an integer describing  $maxes[i]$  where  $0 \leq i < m$ .

#### Sample Case 0

##### Sample Input 0

```
4
1
4
2
4
2
3
5
```

##### Sample Output 0

```
2
4
```

##### Explanation 0

We are given  $n = 4$ ,  $nums = [1, 4, 2, 4]$ ,  $m = 2$ , and  $maxes = [3, 5]$ .

1. For  $maxes[0] = 3$ , we have 2 elements in  $nums$  ( $nums[0] = 1$  and  $nums[2] = 2$ ) that are  $\leq maxes[0]$ .
2. For  $maxes[1] = 5$ , we have 4 elements in  $nums$  ( $nums[0] = 1$ ,  $nums[1] = 4$ ,  $nums[2] = 2$ , and  $nums[3] = 4$ ) that are  $\leq maxes[1]$ .

Thus, the program returns the array  $[2, 4]$  as the answer.

#### Sample Case 1

##### Sample Input 1

```
5
2
10
5
4
8
4
3
```

1  
7  
8

### Sample Output 1

1  
0  
3  
4

### Explanation 1

We are given,  $n = 5$ ,  $nums = [2, 10, 5, 4, 8]$ ,  $m = 4$ , and  $maxes = [3, 1, 7, 8]$ .

1. For  $maxes[0] = 3$ , we have 1 element in  $nums$  ( $nums[0] = 2$ ) that is  $\leq maxes[0]$ .
2. For  $maxes[1] = 1$ , there are 0 elements in  $nums$  that are  $\leq maxes[1]$ .
3. For  $maxes[2] = 7$ , we have 3 elements in  $nums$  ( $nums[0] = 2$ ,  $nums[2] = 5$ , and  $nums[3] = 4$ ) that are  $\leq maxes[2]$ .
4. For  $maxes[3] = 8$ , we have 4 elements in  $nums$  ( $nums[0] = 2$ ,  $nums[2] = 5$ ,  $nums[3] = 4$ , and  $nums[4] = 8$ ) that are  $\leq maxes[3]$ .

Thus, the program returns the array  $[1, 0, 3, 4]$  as the answer.

Answer:(penalty regime: 0 %)

```
1 n=int(input())
2 nums=[int(input()) for _ in range(n)]
3 m=int(input())
4 maxes=[int(input()) for _ in range(m)]
5 res=[]
6 for max1 in maxes:
7     count=0
8     for num in nums:
9         if num<=max1:
10             count+=1
11     res.append(count)
12 for count in res:
13     print(count)
```
